A grayscale topographic map of the Challis, Idaho region, showing rugged terrain with numerous peaks, valleys, and ridges. The map is oriented with north at the top. The text is overlaid on the map in a bright yellow color.

Continuing Seismicity near Challis, Idaho

Conclusions

- Recent activity fits a pattern of continuing seismicity propagating NW from the 1983 Borah Peak earthquake.
- The causative faults are not obvious from the hypocenter distribution but more than one fault must be involved.
- NE-SW oriented extension is driving recent seismicity.
- Complex seismicity pattern may reflect behavior near the end of a Basin and Range fault.
- Central Idaho needs improved seismic monitoring infrastructure.
