PHULAD SHEAR ZONE, RAJASTHAN, NW INDIA: THE PROPOSED MID-NEOPROTEROZOIC SUTURE FOR THE GREATER INDIA LANDMASS

Sadhana M. Chatterjee*, Manishda Roy Choudhury, Subhrajyoti Das and Aliq Roy

Department of Geology, Indian Institute of Technology, 180, Raj S. C. Muzumdar Road, Kharagpur, Kharagpur, 721305, India. * Email: smc@iitkgp.ac.in

1. Introduction

The present study is to determine the tectonic association of the Phulad shear zone with the Phalguni granulite belt of the Meso-Neoproterozoic Aravalli duk. The Phalguni granulite belt is the western boundary belt of the Mesoproterozoic Phalguni orogen in the Indian shield. The Phalguni orogen is an important orogen that has been repeatedly tectonosedimentary in the Proterozoic. The Phalguni granulite belt is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision.

2. Structure in the Phulad Shear Zone

The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision.

3. Tectonic and Mineralogy

The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision.

4. Discussion

The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision. The Phulad shear zone is a region of high-grade metamorphism and deformation, which has been interpreted as a result of subduction and collision.
