**INTRODUCTION**

"Graduate geologists who have trained without the benefits of extensive geological fieldwork are the training system without ever allowing them to digest a career" (Blichert & others, 2003).

The main goal of the project is to "serve" geological eden over the world and serve personal goals of the students and faculty by engaging the learning process through both virtual and field research experiences. The Virtual Geology Field Trip Program in the Carolina T errane, as part of the Carolina T errane, is designed to introduce students to a wide range of geological topics and research. The program uses a variety of tools and techniques, such as field observations, virtual models, and interactive maps, to help students develop a deeper understanding of geological processes and environments.

**VIRTUAL FIELD TRIP CASE STUDY: MORGOR MOUNTAIN STATE PARK, NC**

At Hanging Rock State Park, the meta-graywacke was studied by the Carolina Conservation Corps (CCC) in the 1930s. The park is located in the Carolina T errane, which includes the Piedmont, the Coastal Plain, and the Blue Ridge Mountains, and is a part of the Carolina T errane. The Carolina T errane is a region that includes the Piedmont, the Coastal Plain, and the Blue Ridge Mountains, and is a part of the Carolina T errane.
